Introduction

Trane is a leader in the air-cooled chillers marketplace, thanks to excellence in design and manufacturing. This tradition of excellence is present in the Conquest air-cooled scroll compressor chillers range, a new generation of chillers and heat pumps, providing capacities from 42-160 kW.

Trane Quality

Trane is the designer and manufacturer of the core components applying modern market standards of quality in the finishing, a rigorous testing and manufacturing plan, a powerful service portfolio supporting the life cycle of the equipment.

Useful Efficiency

The cooling only chillers, model CGAX, are rated Class B (EER at full load at Eurovent conditions) and optimized for operation at seasonal part load efficiency (ESEER) to maximize energy savings during real life building demand, across all seasons.

The heat pump version, model CXAX, has been optimized in the same way. Full Load COP is class B as per Eurovent standard as well, while the part load efficiency ratio SCOP is compliant with Ecodesign directive.

Acoustic Package

Two acoustical package options are available:

- Standard Noise (SN), with an average sound power of Lw 86 dB(A)
- Low Noise (LN), for sensitive environments with a sound reduction of an additional -6 dB(A)

The acoustical package does not bring any degradation on the performances: cooling capacity, operating map, or efficiency.

Smart Chillers

- The operating map of the chiller, allows in cooling mode, operation between -18°C up to 46°C ambient air temperature.
- In heating mode, CXAX units can deliver 40°C hot water, down to -15°C ambient air temperature.
- For industrial applications, with evaporator leaving water temperature down to -12°C is Ecodesign compliant (SEPR medium temperature > 2,8).
- The low profile of the Conquest units allows easy integration in buildings, thanks to the 1,5 m of height on most of the units.
- A plug & play integration is supported by the option of Hydraulic Module (with or without buffer tank).
- Chillers are provided with a Smart Controller and a new generation interface, the Deluxe Touch Display.
- Full integrability capability thanks to available communication protocols: Modbus, BACnet, LonTalk and Trane BMS.

Features and Benefits

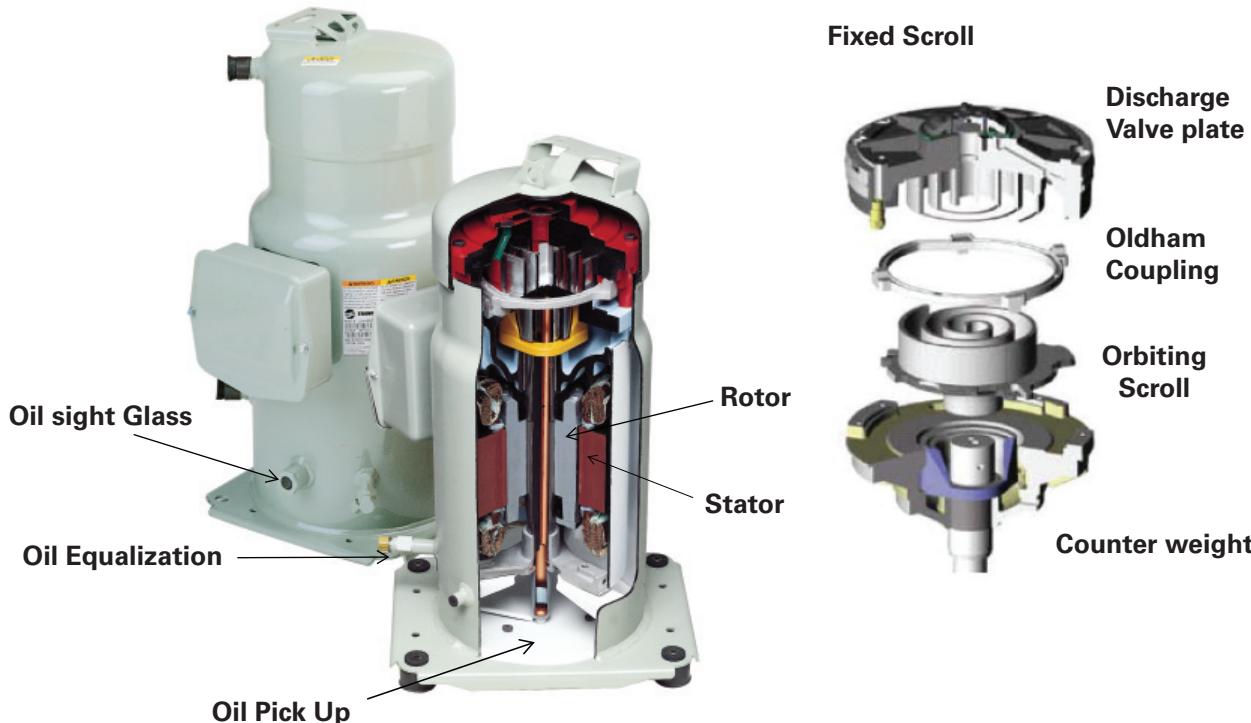

Reliability

A robust design of the compressor and refrigerant circuit has been validated by an extensive program of operational tests, in extreme conditions, to ensure maximum reliability. Quality is verified during each and every step.

Compressors

Direct drive, low speed, new generation of scroll compressor, with few moving parts, providing high efficiency, reliable operation and simplified maintenance. Suction gas cooled motor winding, maintaining uniform low temperature for extended motor life.

Figure 1 – Scroll compressor

Chiller controller

The Conquest chiller is equipped with the new generation of chiller control systems, providing improved control capabilities, and integrated safety protocols to protect both compressors and motors from electrical faults like thermal overload and phase reversal.

The LCD display with 6 navigation buttons shows clear messages in 15 available languages. It features a customer communication package consisting in: external chilled water setpoint, external demand limit, analog capacity output, programmable relays.

Figure 2 – Standard LCD user interface

Features and Benefits

A deluxe display is available as an option. It features an intuitive and user friendly color 7 inch touchscreen, able to display: Data trending, clear alarms logging, and TIS enable for remote monitoring.

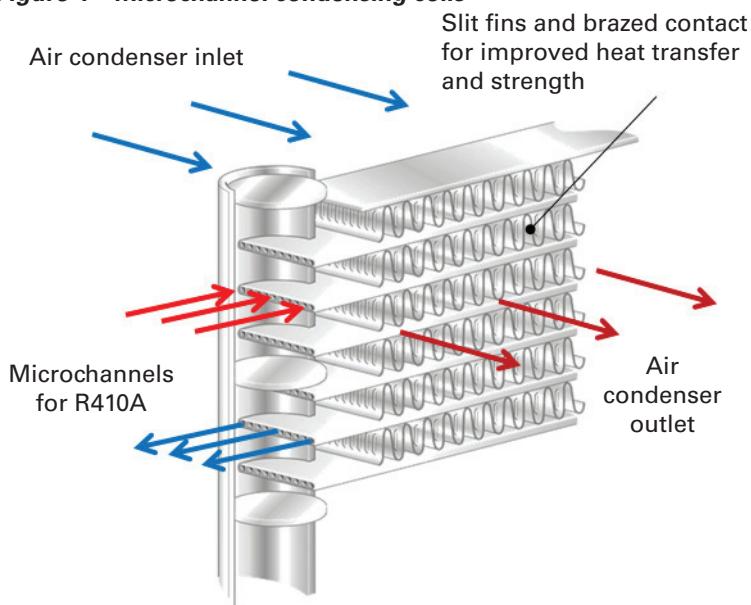

Figure 3 – Optional deluxe user interface

Microchannel condensing coils on cooling-only units

Conquest chillers are equipped with microchannel condensing coils allowing excellent heat transfer and a dramatic improvement of corrosion resistance versus conventional tubes in fins coils. Microchannel coils are 100% aluminum, therefore avoiding galvanic corrosion which can occur on conventional condensers made with copper tubes and aluminum fins. Microchannel coils are also well adapted for dirty environment thanks to their small thickness and fins profile.

Figure 4 – Microchannel condensing coils

Heat pump units coils

The condenser coil is made of aluminum fins mechanically bonded to seamless copper tubing and includes integral subcooling circuit. The coils are factory leak tested at 5 Mpa. If the unit is to be installed in a corrosive environment, aluminum fins can be pre-coated with epoxy (optional), with minimum thickness of 8µm, in order to withstand 1000 hours of salt spray test according to ISO 9227.

Electronic Expansion Valve

Electronic expansion valve enables tight chilled water temperature control and low superheat, resulting in more efficient full-load and part-load operation.

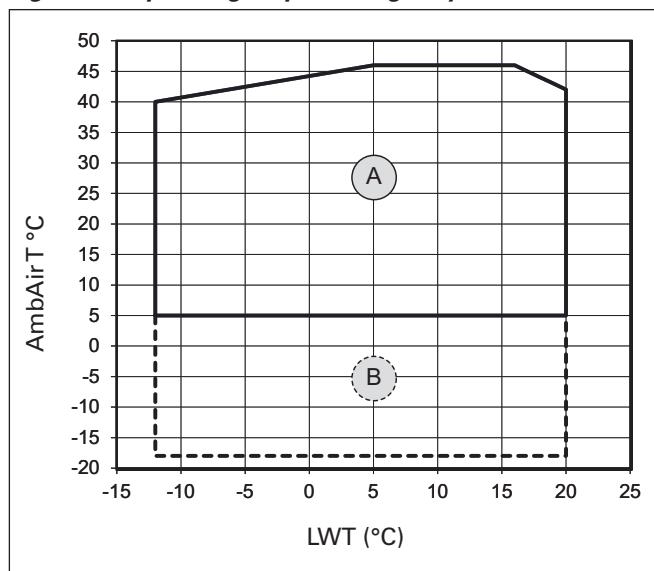

Features and Benefits

Application versatility

Extended operating map, allowing chiller operation in multiple applications:

- Industrial/low temperature process cooling with precise temperature control capability.
- Optimal and reliable operation at high ambient temperatures.

Figure 5 – Operating map- Cooling-only Model CGAX

LWT = Leaving water temperature

Amb AirT = Ambient air temperature

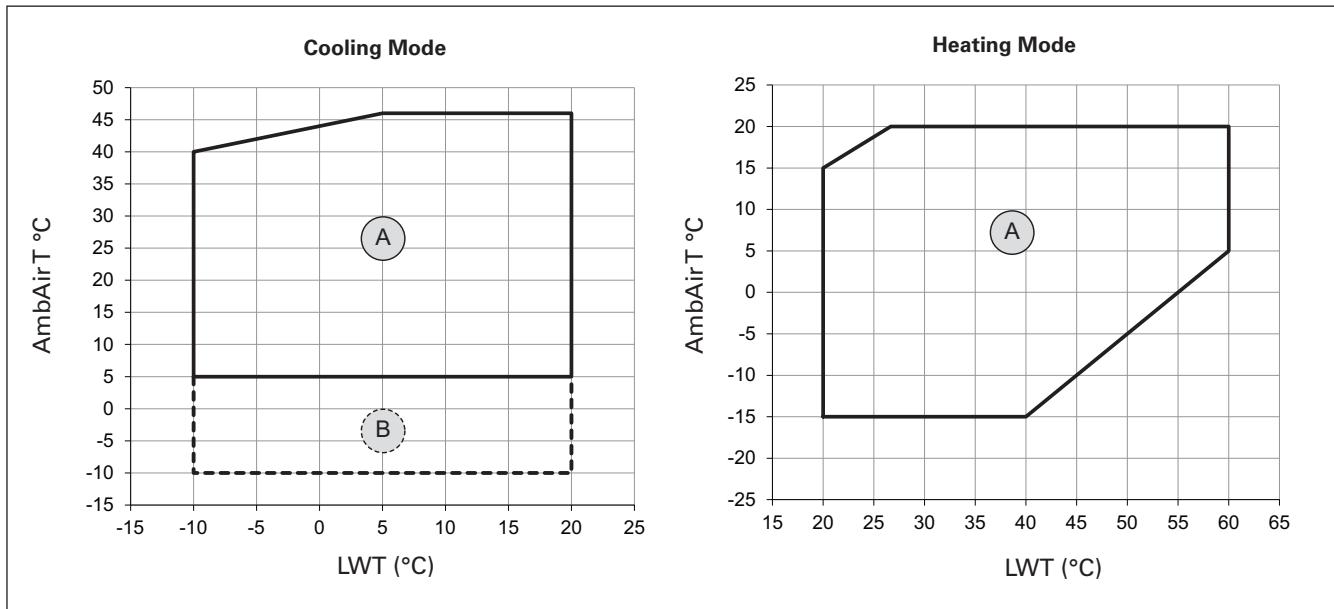

A = Standard operating map

B = Low ambient operating map (Variable air flow control)

Minimum start-up/operation ambient based on a 2.22 m/s (5mph) wind across the condenser

Features and Benefits

Amb Air T = Ambient air temperature

A = Standard operating map

B = Low ambient operating map (Variable air flow control)

Minimum start-up/operation ambient based on a 2.22 m/s (5mph) wind across the condenser

Improved Serviceability

- All main components like compressors, valves and refrigerant components are easy to access to simplify servicing. When the unit is supplied with an hydraulic module, the service valves and strainer can be accessed with ease for service.
- Water connections are extended up to the edge of the unit, for easy connection with system water piping.
- Optional pump package is designed for easy maintenance and service on site.
- Pressure transducers and temperature sensors are supplied for easy identification of potential troubleshooting and eventually, replacement, without the need of refrigerant handling.
- Dead front panel and IP20 protection allow for safe servicing.

Application Considerations

Certain applications constraints should be considered when sizing, selecting and installing Conquest air-cooled Scroll chillers. Unit and system reliability often depend on proper and complete compliance with those considerations.

Unit Size

Unit oversizing is often not recommended since erratic unit operation and excessive compressor cycling are often a direct result of an oversized chiller. If oversizing is desired, consider the alternative of multiple units, splitting the total capacity.

Water Treatment

The use of untreated or improperly treated water in chillers may result in scaling, erosion, corrosion, and algae or slime buildup. This will adversely affect heat transfer between the water and system components. Proper water treatment must be determined locally and depends on the type of system and local water characteristics.

Neither salty nor brackish water is recommended for use in Trane air-cooled Conquest chiller. Usage of either will lead to a shortened life. Trane encourages the employment of a qualified water treatment specialist, familiar with local water conditions, to assist in the establishment of a proper water treatment program.

Foreign matter in the chilled water system can also increase pressure drop and, consequently, reduce water flow. For this reason it is important to thoroughly flush all water piping to the unit before making the final piping connections to the unit.

Effect of the altitude on the cooling capacity

At elevations substantially above sea level, the decreased air density will decrease condenser capacity and, therefore, unit capacity and efficiency.

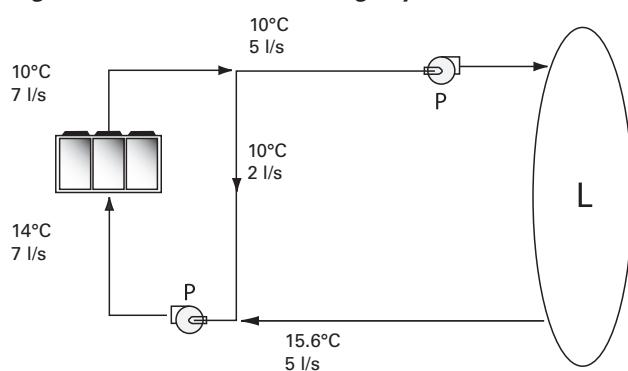

Water flow limits

The minimum water flow rates are given in the General Data section of this catalog. Evaporator flow rates below the tabulated values will result in laminar flow causing freeze-up problems, scaling, stratification and poor control. The maximum evaporator water flow rate is also given. Flow rates exceeding those listed may result in very high pressure drop across the evaporator.

Flow Rates Out of Range

Many process cooling jobs require flow rates that cannot be met with the minimum and maximum published values within the Conquest chiller evaporator. A simple piping change can alleviate this problem. For example: a plastic injection molding process requires 5.0 l/s of 10°C water and returns that water at 15.6°C. The selected chiller can operate at these temperatures, but has a minimum flow rate of 6.6 l/s. The system layout in Figure 7 can satisfy the process.

Figure 7 – Flow rate out of range systems solution

L = Load

P = Pump

Application Considerations

Flow Proving

Trane provides a factory-installed water flow switch monitored by chiller controller CH535 which protects the chiller from operating in loss of flow conditions.

Leaving Water Temperature Limits

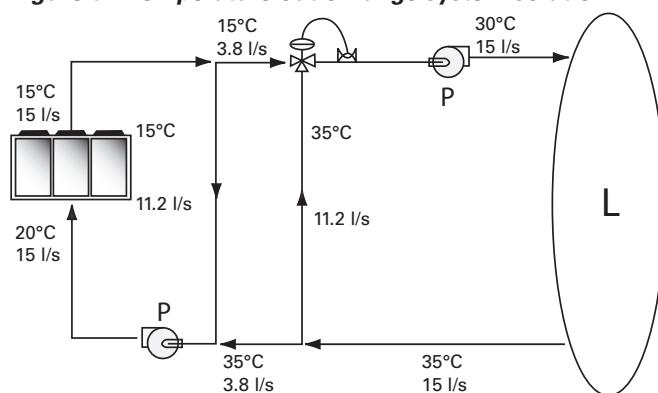

Trane air-cooled Conquest chillers have two distinct leaving water categories:

- standard, with a leaving solution range of 5.5 to 18°C
- low temperature process cooling, with leaving solution range of -12 to 18°C

Since the leaving solution temperature below 5.5°C results in suction temperature at or below the freezing point of water, a glycol solution is required for all low temperature.

Consult your local Trane sales engineer for applications or selections involving low temperature. The maximum water temperature that can be circulated through the CGAX evaporator when the unit is not operating is 51.7°C. For the model CXAX the water temperature limit is 60°C. Evaporator damage may result above this temperature.

Figure 8 – Temperature out of range system solution

L = Load

P = Pump

Supply Water Temperature Drop

Full load chilled water temperature drops from 3.3 °C to 10°C may be used as long as minimum and maximum water temperature and minimum and maximum flow rates are not violated.

Temperature drops outside this range at full load conditions are beyond the optimum range for control and may adversely affect the microcomputer's ability to maintain an acceptable supply water temperature range. Furthermore, full load temperature drops of less than 3.3°C may result in inadequate refrigerant superheat which is critical to long term efficient and reliable operation.

Sufficient superheat is always a primary concern in any refrigerant system and is especially important in a packaged chiller where the evaporator is closely coupled to the compressor.

Parameters which influence the water temperature stability:

- Ambient temperature and water temperature (modify cooling capacity)
- Number of capacity steps
- Minimum time between starts of a compressor
- Control dead band
- Water loop volume
- Load fluctuations
- Fluid type or percentage of glycol

Typical Water Piping

All building water piping must be flushed prior to making final connections to the chiller. To reduce heat loss and prevent condensation, insulation should be applied. Expansion tanks are also usually required so that chilled water volume changes can be accommodated.

Application Considerations

Avoidance of Short Water Loops

Adequate chilled water system water volume is an important system design parameter because it provides for stable chilled water temperature control and helps limit unacceptable short cycling of chiller compressors.

The Conquest Air Cooled chiller's temperature control sensor is located in the supply (outlet) water connection or pipe. This location allows the building to act as a buffer to slow the rate of change of the system water temperature. If there is not a sufficient volume of water in the system to provide an adequate buffer, temperature control can suffer, resulting in erratic system operation and excessive compressor cycling.

Typically, a two-minute water loop circulation time is sufficient to prevent short water loop issues. Therefore, as a guideline, ensure the volume of water in the chilled water loop equals or exceeds two times the evaporator flow rate. For systems with a rapidly changing load profile the amount of volume should be increased.

If the installed system volume does not meet the above recommendations, the following items should be given careful consideration to increase the volume of water in the system and, therefore, reduce the rate of change of the return water temperature.

- A volume buffer tank located in the return water piping.
- Larger system supply and return header piping (which also reduces system pressure drop and pump energy use).

An optional factory-installed buffer tank is designed to meet the minimum two minute loop time without additional job site piping. The buffer tank can also be used on jobs that already meet or exceed the minimum loop time to further reduce the potential for compressor cycling, increasing the compressor life span, and reducing system temperature fluctuations.

Minimum water volume for a process application

If a chiller is attached to an on/off load such as a process load, it may be difficult for the controller to respond quickly enough to the very rapid change in return solution temperature if the system has only the minimum water volume recommended. Such systems may cause chiller low temperature safety trips or in the extreme case evaporator freezing. In this case, it may be necessary to add or increase the size of the mixing tank in the return line or consider the optional factory-installed buffer tank with the chiller. Some guidance on calculating the minimum volume necessary for proper Scroll Compressors Chillers operation are given here, through a simplified formula, which does not take in account variations on chiller efficiency, compressor sequencing, evaporator inlet/outlet temperature.

Minimum recommendable volume on the hydraulic loop

$V = C_c * T / (S_h * D_b)$ where:

$C_c * T = V * D_b * S_h$

V = Volume of the loop (l)

C_c = Cooling Capacity of the chiller biggest Stage (kW)

T = Compressor Time (min running time (s))

D_b = Dead Band (K)

S_h = Brine Specific heat (kJ.K-1.kg-1)

Multiple Unit Operation

Whenever two or more units are used on one chilled water loop, Trane recommends that their operation be coordinated with a higher level system controller for best system efficiency and reliability. The Trane Tracer system has advanced chilled plant control capabilities designed to provide such operation.

Unit Placement

Setting The Unit

A base or foundation is not required if the selected unit location is level and strong enough to support the unit's operating weight (see "Weights" section of this catalog).

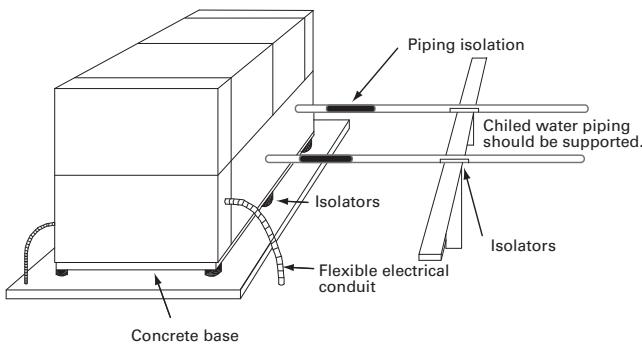

For a detailed discussion of base and foundation construction, refer to the sound engineering bulletin or the unit IOM. Manuals are available through the local Trane office.

HVAC equipment must be located to minimize sound and vibration transmission to the occupied spaces of the building structure it serves. If the equipment must be located in close proximity to a building, it should be placed next to an unoccupied space such as a storage room, mechanical room, etc. It is not recommended to locate the equipment near occupied, sound sensitive areas of the building or near windows. Locating the equipment away from structures will also prevent sound reflection, which can increase sound levels at property lines or other sensitive points.

Isolation and Sound Emission

Structurally transmitted sound can be reduced by elastomeric vibration eliminators. Elastomeric isolators are generally effective in reducing vibratory noise generated by compressors, and therefore, are recommended for sound sensitive installations. An acoustical engineer should always be consulted in critical situations.

Figure 9 – Installation example

For maximum isolation effect, water lines and electrical conduit should also be isolated. Wall sleeves and rubber isolated piping hangers can be used to reduce the sound transmitted through water piping. To reduce the sound transmitted through electrical conduit, use flexible electrical conduit.

Local codes on sound emissions should always be considered. Since the environment in which a sound source is located affects sound pressure, unit placement must be carefully evaluated. Sound power levels for chillers are available on request.

Servicing

Adequate clearance for evaporator and compressor servicing should be provided. Recommended minimum space envelopes for servicing are located in the dimensional data section and can serve as a guideline for providing adequate clearance. The minimum space envelopes also allow for control panel door swing and routine maintenance requirements. Local code requirements may take precedence.

Unit Placement

Unit Location

General

Unobstructed flow of condenser air is essential to maintain chiller capacity and operating efficiency. When determining unit placement, careful consideration must be given to assure a sufficient flow of air across the condenser heat transfer surface. Two detrimental conditions are possible and must be avoided: warm air recirculation and coil starvation. Air recirculation occurs when discharge air from the condenser fans is recycled back to the condenser coil inlet. Coil starvation occurs when free airflow to the condenser is restricted.

Condenser coils and fan discharge must be kept free of snow or other obstructions to permit adequate airflow for satisfactory unit operation. Debris, trash, supplies, etc., should not be allowed to accumulate in the vicinity of the air-cooled chiller. Supply air movement may draw debris into the condenser coil, blocking spaces between coil fins and causing coil starvation.

Both warm air recirculation and coil starvation cause reductions in unit efficiency and capacity because of the higher head pressures associated with them. The air-cooled Conquest chiller offers an advantage over competitive equipment in these situations. Operation is minimally affected in many restricted air flow situations due to its advanced chiller controller.

Microprocessor which has the ability to understand the operating environment of the chiller and adapt to it by first optimizing its performance and then staying on line through abnormal conditions. For example, high ambient temperatures combined with a restricted air flow situation will generally not cause the air-cooled model CGAX chiller to shut down. Other chillers would typically shut down on a high pressure nuisance cut-out in these conditions.

Cross winds, those perpendicular to the condenser, tend to aid efficient operation in warmer ambient conditions. However, they tend to be detrimental to operation in lower ambients due to the accompanying loss of adequate head pressure. Special consideration should be given to low ambient units. As a result, it is advisable to protect air-cooled chillers from continuous direct winds exceeding 4.5 m/s in low ambient conditions.

Provide Sufficient Unit-to-Unit Clearance

Units should be separated from each other by sufficient distance to prevent warm air recirculation or coil starvation. Doubling the recommended single unit air-cooled chiller clearances will generally prove to be adequate.

Walled Enclosure Installations

When the unit is placed in an enclosure or small depression, the top of the surrounding walls should be no higher than the top of the fans. The chiller should be completely open above the fandek. There should be no roof or structure covering the top of the chiller. Ducting individual fans is not recommended.

Model Number Description

POE Oil type					OIL058E / OIL057E		

(1) At Evaporator water temperature : 12°C / 7°C - Condenser air temperature 35°C according to EN14511:2013

(2) At Evaporator water temperature : 6.6°C (44°F) / 12.2°C (54°F) - condenser air temperature 46°C (114.8°F)

(4) under 400V/3/50Hz

(5) Rated Condition without Pump Package

(6) Percent minimum load can be lowered on demand to local sales office.

(7) Minimum start-up/operation ambient based on a 2.22 m/s (5mph) wind across the condenser.

(8) Maximum ambient operation is for unit at 12°C / 7°C

(9) If the power line of the unit is protected by fuses gG of the same size as the disconnect switch.

Electrical & system data are subject to change without notice. Please refer to unit nameplate data.

POE Oil type				OIL058E / OIL057E			

(1) At Evaporator water temperature : 12°C / 7°C - Condenser air temperature 35°C according to EN14511:2013

(4) under 400V/3/50Hz

(5) Rated Condition without Pump Package

(6) Percent minimum load can be lowered on demand to local sales office.

(7) Minimum start-up/operation ambient based on a 2.22 m/s (5mph) wind across the condenser.

(8) Maximum ambient operation is for unit at 12°C / 7°C

(9) If the power line of the unit is protected by fuses gG of the same size as the disconnect switch.

Electrical & system data are subject to change without notice. Please refer to unit nameplate data.

POE Oil type					OIL058E / OIL057E		

(1) At Evaporator water temperature : 12°C / 7°C - Condenser air temperature 35°C according to EN14511:2013

(2) At Evaporator water temperature : 40°C / 45°C - Condenser air. DB/WB 7°C/6°C according to EN14511:2013

(4) under 400V/3/50Hz

(5) Rated Condition without Pump Package

(6) Minimum ambient in heating operation is for unit at 40°C / 45°C

(7) Minimum start-up/operation ambient based on a 2.22 m/s (5mph) wind across the condenser.

(8) Maximum ambient operation is for unit at 12°C / 7°C

(9) If the power line of the unit is protected by fuses gG of the same size as the disconnect switch.

Mechanical Specifications

General

Chiller is designed for outdoor application strictly in accordance with specifications and it will be shipped with a full operating charge of R410A refrigerant and lubrication oil scroll compressors and electronic expansion valve.

Quality assurance

Chiller is designed and manufactured under a quality assurance system and environmental management system certified in accordance with standard ISO 9001:2008 and ISO14001.

All chillers follow a production quality plan to ensure proper construction and operation including electrical sequence running test.

Unit construction is in accordance with the following European directives:

- Machinery Directive (MD) 2006/42/CE
- Low Voltage Directive (LV) 2006/95/CE
- ElectroMagnetic Compatibility Directive (EMC) 2004/108/CE
- Electrical Machinery Safety Standard EN 60204-1

Construction characteristics

Chiller casing and electrical panels are made of galvanized steel of 1.5 mm thickness mounted on a riveted structural steel entirely painted base. Unit panels frames and exposed steel surfaces are painted and have a corrosion resistance of 1500 hours to salt spray test according ISO 9227. Electrical panel is rated as minimum. IP54 fully factory mounted and wired with access door clearly visible from outside with power on/off indication.

Compressors and Motors

Chiller are provided with hermetic Scroll compressors:

- Direct drive 2900 rpm
- Suction gas cooled hermetic motor
- Built-in centrifugal oil pump
- Built-in oil level sight glass and oil charging valve

Compressor motors have a voltage utilization range of $\pm 10\%$ on nameplate voltage internal temperature and current-sensitive motor overload is included for maximum protection.

Evaporator

The evaporator is a single brazed plate heat exchanger made of stainless steel 316 L and copper brazing designed to operate properly and efficiently with a refrigerant charge.

Maximum operating pressure on water side does not exceed 1MPa. The evaporator is fully insulated with appropriate thickness and close cell type insulation protected against freezing either with a control activated heater either with a pump activation sequence whenever the ambient temperature will be below 3°C. It has only one entering and only one leaving water connection.

Chiller is able to supply water temperature leaving the evaporator:

- For comfort application: between 5°C / 20°C
- For process application:
 - Between -12°C and 5°C on cooling only units (CGAX)
 - Between -10°C and 5°C on heat pump units (CXAX)

Mechanical Specifications

Condenser coil and fans

Ambient temperature operating map is as minimum:

- Cooling only: 5°C (-18°C with Low Ambient Option) up to 46°C
- Heating mode: -15°C up to 20°C

Cooling-only units coils

Condenser coil is Microchannel type made in aluminum brazed fin construction; coils will consist of three main components: flat microchannel tube fins in between the microchannel tubes and two refrigerant manifolds. Coil are cleanable using a high pressure water stream. Condenser coil includes an integral subcooling circuit. An option for E-coating or complete coil coating shall be available.

Heat pump units coils

Condenser coil is made of aluminum fins mechanically bonded to seamless copper tubing and includes integral subcooling circuit. Coils are factory leak tested at 3.2Mpa under water. If unit will be installed on corrosive environment aluminum fins are pre-coated with epoxy with minimum thickness of 8µm in order to withstand 1000 hours of salt spray test according ISO 9227.

Chillers are equipped with axial condenser fan and motors with permanently lubricated ball bearings and external overload protection shall be provided. Fans motors are class F powered through an IP55 electrical box.

Refrigerant Circuit

Each refrigerant circuit includes compressor(s) high and low pressure transducer permanent liquid filter drier electronic expansion valve pressure port on each refrigerant line full operating charge of R410A and POE oil as long as high pressure side pressostat.

Oil Management

The chiller is equipped with an oil management system consisting of an oil pump integrated on the compressor to ensure proper oil circulation throughout the unit and a crankcase heater integrated in the compressor to avoid startup with low oil temperature. Unit is delivered with operating oil charge factory supplied and checked (Trane recommended oil OIL 0057E or OIL 0058E).

Electrical panel

Unit is provided with a weatherproof control and IP54 power panel with a single point connection with disconnect switch. The disconnect switch is mechanically interlocked to disconnect line power from power panel accessible from the outside the chiller. All components and control cables are numbered in accordance with CEI 60750. The unit is equipped with a control power transformer with two secondary control circuits:

- 230 V single phase connection for evaporator freeze protection heaters and control board
- 24 V single phase connection for the human interface control.

Each compressor is provided with a direct on line starter factory mounted wired and tested. Soft Starter is available as an option.

Mechanical Specifications

Hydraulic module (option)

Hydraulic module is integrated within the chiller frame field pipe connection is Victaulic and is outside of the unit casing. Hydraulic kit has the following factory mounted components:

- Single or double pump (in this case manifolded in parallel one pump working as redundancy of the other) factory mounted wired and tested with check valve in the discharge. Options for standard and high pressure shall be available.
- Pump crankcase shall be in polyamid impeller in propylene dynamically balanced. Pump rated for 1MPa working pressure.
- Pre-charged expansion tank.
- Flow switch.
- Water strainer able to retain particles above 1mm of diameter.
- Water pressure relief valve.
- Electrical heater for freezing protection up to -10°C.
- Cold critical parts such the brazed plate evaporator will be insulated with a closed cell foam insulation against condensation of minimum 13 mm.
- Freeze protection shall be made by pump activation as standard.
- As an option unit shall include a water buffer tank insulated with closed cell foam of 13mm with antifreezing protection. Buffer tank will fit into the chiller to minimize the system footprint.

Chiller Control System CH535

Chilled water temperature control is fulfilled through a microprocessor based controller monitoring water and refrigerant temperature as long as refrigerant pressure. Controller is able to generate adequate operational diagnostics.

The Microprocessor based controller is supplied factory mounted fully wired configured and tested in factory and it ensures compressor and fan sequence (load control) fault detection diagnostic and supervision.

The following features are present on the chiller operational control

- High and low refrigerant pressure protection
- Load limit control to limit compressor loading on high return water temperature
- Condenser fan sequencing with automatically cycling in response to ambient condensing pressure.
- Compressors anti-short cycle timer protection adjustable
- Automatic compressor lead-lag to even out run hours and compressors starts
- Phase reversal/single phasing protection
- Low ambient lockout control with adjustable set point
- Integrated RS485 serial port to allow BMS connectivity
- Options for communication protocols: ModBus, LonTalk and BACnet should be available

User display interface are provided on the external wall of the chiller allowing complete graphic management through icons and touchscreen display:

- Leaving chilled water setpoint adjustment
- Entering and leaving water temperatures display
- Condenser pressure per circuit
- Suction pressure per circuit
- Air ambient temperature
- Condensing temperature per circuit
- Suction temperature per circuit

Safety control readouts on the user display:

- Low chilled water temperature detection
- High refrigerant pressure
- Loss of chilled water flow
- Contact to external shut-down per circuit
- Motor current overload
- Phase reversal/unbalance/single phasing
- Failure of leaving water temperature sensor used to drive the set point
- Compressor status (on/off)

Options

Application options

Low ambient option

The low ambient option permits unit controls to allow start and operation down to ambient temperatures of -18°C (-0.4°F) for CGAX units; -10°C (26.4°F) for CGAX heat pump in cooling mode if there is sufficient glycol in the evaporator to prevent freezing.

Low noise sound level option

Low noise units are equipped with a jacket encapsulating each compressor for sound reduction.

SmartFlow Control

Constant speed pump – Variable frequency drive adjustment

The unit is equipped with a pump package driven by a speed inverter, without providing continuous modulation of the speed. The water flow is fixed during commissioning. The goal of this alternative is to provide the appropriate flow rate and hydraulic balance, without the need for a mechanical balancing valve, and by taking advantage of the energy consumption optimization of the pump.

Water flow is adjusted through parameter 204 of the speed inverter (TR200), when having the dual pump option, the active pump arbitration is based on pump equalization time and pump failure status.

Variable speed pump – Constant differential pressure (DP)

The unit is equipped with a pump package driven by a speed inverter. The modulation of the pump speed is made in order to ensure that the Differential Pressure (DP) remains constant within the system. The minimum pump speed is factory set at 60% of the nominal speed. The minimum pump frequency can be adjusted through inverter. The constant DP option is intended to be used with 2-way water regulation valves in the customer hydraulic system. At minimum system partial load, when most of the 2-way valves are closed, a minimum flow rate must be ensured through the chiller evaporator. DP is measured by a differential pressure sensor supplied by Trane, that the customer must install on the water loop, in a freeze protected area. A regulation valve should be installed on the by-pass line.

Variable speed pump – Constant differential temperature (DT)

The unit will be equipped with a pump package driven by a speed inverter. The modulation of the pump speed is managed to ensure that chiller DT stays constant. Entering and leaving temperatures at the evaporator will be measured directly by the chiller controller, through the factory-supplied sensor. A DT setpoint will be present on the unit controller. The option for constant DT is intended to be used with 3-way valves on water systems, or 2-way valves on water system but constant flow at the by-pass. The minimum pump frequency can be adjusted on the inverter.

Partial Heat Recovery

Heat recovery appears more and more as a sensible response to offset energy costs continually on the rise. The Trane Conquest chillers with Partial Heat Recovery option combines the energy savings of heat recovery operation with the installation and maintenance cost savings of completely factory packaged air cooled liquid chillers. The CGAX or CXAX in cooling mode with Heat Recovery option operate as a standard unit as long as heat is not required or it can simultaneously produce chilled and hot water which can be used for applications like: Heating or preheating of boiler systems or domestic cater, Air conditioning/ventilation air pre-heat, and Industrial processes.

The Heat Recovery Exchanger is a brazed plate exchanger , connected to the compressor discharge line, and sized to recover up to 20% of the nominal cooling capacity.

The Heat Recovery Exchanger is not approved for Food and Beverage applications. The use of a primary loop is mandatory.

Options

Communication options

BACnet™ communication interface

Allows the user to easily interface with BACnet via a single twisted pair wiring to a factory installed and tested communication board.

LonTalk™ communication interface

Allows the user to easily interface with LonTalk via a single twisted pair wiring to a factory installed and tested communication board.

ModBus™ communication interface

Allows the user to easily interface with ModBus via a single twisted pair wiring to a factory installed and tested communication board.

Other options

Coated condensing coils

For cooling only units (CGAX) a complete coating on microchannel condenser coils shall be available.

For Heat Pump units (CXAX) pre-coated aluminium epoxy fins shall be available.

Compressors soft starters

Electronic solid state soft starter shall be available.

Deluxe display

For a remote display type Deluxe is available.
